heme: $\qquad$

## Enmirical Formaler \& Moleculer Formata

Today we will study empirical and molecular formulas. An empirical formula for a compound is the formula written in its most reduced form. A molecular formula is the formula for the compound as it exists in nature. For example: the molecular formula for hydrogen peroxide is $\mathbf{H}_{2} \mathbf{O}_{2}$. The empirical formula for hydrogen peroxide is $\mathbf{H O}$. Basically, all we are doing is reducing the ratiobetween the elements to its lowest common factor.

On many occasions, the empirical formula and the molecular formula will be the same. For example: the molecular formula for water is $\mathrm{H}_{2} \mathrm{O}$. Since the $2: 1$ ratio between hydrogen and oxygen cannot reduce, the empirical formula for water is also $\mathrm{H}_{2} \mathrm{O}$.

## Part I: Calculating Empirical Formulas

When determining empirical formula, you will be given either a percent composition of the elements in the compound or the mass of the elements in the compound. In either case, the steps are exactly the same.

Example \#1: A compound consists of $72.2 \%$ magnesium and $27.8 \%$ nitrogen by mass. What is the empirical formula?

| Description of Action | Action |
| :--- | :--- |
| 1. Divide each element's percent composition or mass <br> composition by its atomic weight. Rememb er to use <br> significant figures. | 1. $\mathrm{Mg}: 72.2 \div 24.3=\mathbf{2 . 9 7}$ <br> $\mathrm{N}: 27.8 \div 14.0=\mathbf{1 . 9 8}$ |
| 2. Divide each result by the smallest result. Remember to <br> use significant figures. | 2. $\mathrm{Mg}: 2.97 \div 1.98=\mathbf{1 . 5 0}$ <br> $\mathrm{N}: 1.98 \div 1.98=\mathbf{1 . 0 0}$ |
| 3. Multiply each result by the same whole number until <br> both equal a whole number (or at least within a couple <br> hundredths). Hint: start at 2 and work your way up. | 3. $\mathrm{Mg}: 1.50 \times 2=\mathbf{3}$ <br> $\mathrm{N}: 1.00 \times 2=\mathbf{2}$ |
| 4. Write the formula with the each element's result as its <br> subscript. | 4. $\mathbf{M g}_{\mathbf{3}} \mathbf{N}_{\mathbf{2}}$ |
| 5. Name the compound. Note: If you see a compound that <br> we have not yet learned how to name, you will not have to <br> name it. | 5. magnesium nitride |

Try this one. Determine the empirical formula of a compound that is composed of $36.5 \% \mathrm{Na}, 25.4 \% \mathrm{~S}$, and $38.1 \% \mathrm{O}$.

| Description of Action |  |  |
| :--- | :--- | :--- |
| 1. |  |  |
| 2. |  |  |
| 3. |  |  |
| 4. |  |  |
| 5. |  |  |

## Practice Problem:

1. Calculate the empirical formula and name the compound that contains 1.67 grams of cerium and 4.54 grams of iodine.

Part II: Calculating Molecular Formulas From Empirical Formulas
Example \#1: From above, we see that the empirical formula is $\mathrm{Na}_{2} \mathrm{SO}_{3}$. If the molecular formula mass is $378.3 \mathrm{~g} / \mathrm{mol}$, what is the molecular formula?

| Description of Action | Action |
| :--- | :--- |
| 1. Determine the gram formula mass of the empirical <br> formula. | 1. $\mathrm{Na}: 2 \times 23.0=46.0$ <br> $\mathrm{~S}: 1 \times 32.1=32.1$ <br> $0: 3 \times 16.0=\frac{48.0}{}$ <br> $\mathbf{1 2 6 . 1} \mathbf{~ g / m o l}$ |
| 2. Divide the molecular formula mass by the empirical <br> formula mass. | $\mathbf{2 . 3 7 8 . 3 \div 1 2 6 . 1 = \mathbf { 3 . 0 0 0 }}$ |
| 3. Multiply each subscript in your empirical formula by <br> your result. | 3. $\mathrm{Na}_{2} \mathrm{SO}_{3}$ becomes $\mathbf{N a}_{\mathbf{6}} \mathbf{S}_{\mathbf{3}} \mathrm{O}_{\mathbf{9}}$ because we must multiply <br> each of the formula's subsripts by 3. |

You try this one: For a compound with an empirical formula $\mathrm{CH}_{2} \mathrm{O}$, determine its molecular formula if its molecular formula mass is $180 \mathrm{~g} / \mathrm{mol}$.

| Description of Action |  | Action |
| :--- | :--- | :--- |
| 1. |  |  |
| 2. |  |  |
| 3. |  |  |

Part III: Putting it Together: Empirical Formula \& Molecular Formula
Example \#1: A compound is analyzed and found to contain 32.5\% manganese, $24.9 \%$ silicon, and $42.6 \%$ oxygen. The molecular weight of this compound is known to be approximately $676.2 \mathrm{~g} / \mathrm{mol}$. What is the empirical formula? What is the molecular formula?

| Description of Action | Action |
| :---: | :---: |
| 1. Divide each element's percent composition by its atomic weight. Remember to use significant figures. | $\text { 1. } \begin{aligned} & \text { Mn: } 32.5 \div 54.9=0.592 \\ & \mathrm{Si}: 24.9 \div 28.1=0.886 \\ & \mathrm{O}: 42.6 \div 16.0=2.66 \\ & \hline \end{aligned}$ |
| 2. Divide each of the results by the smallest result. In our example, 0.592 is our smallest result. | $\begin{aligned} & \text { 2. Mn: } 0.592 \div 0.592=1.00 \\ & \text { Si: } 0.886 \div 0.592=1.50 \\ & \text { O: } 2.66 \div 0.592=4.49 \end{aligned}$ |
| 3. Multiply each of your new results by the same whole number until each of their result is a whole number. The best way to do this is to start with two and increase until you find a number that produces all whole number results. | 3. $\mathrm{Mn}: 1.00 \times 2=2$ <br> Si: $\quad 1.50 \times 2=3$ <br> O: $4.49 \times 2=9$ (Rounded from 8.98) |
| 4. Using your hew results as the subscripts for the specific elements, write the formula of the compound. | 4. $\mathrm{Mn}_{2} \mathrm{Si}_{3} \mathrm{O}_{9}$ |
| 5. Determine the gram formula mass of the empirical formula. | 5. Mn: $2 \times 54.9=109.8 ~ \begin{aligned} \text { Si: } 3 \times 28.1=84.3 \\ \mathrm{O}: \quad 9 \times 16.0=\underline{144.0} \mathbf{3 3 8 . 1} \mathbf{g} / \mathbf{m o l}\end{aligned}$ |
| 6. Divide the given molecular formula mass by the calculated gram formula mass. (given $\div$ calculated) | 6. $676.2 \div 338.1=\mathbf{2 . 0 0 0}$ |
| 7. Multiply each subscript in your empirical formula by your result. | 7. $\mathrm{Mn}_{2} \mathrm{Si}_{3} \mathrm{O}_{9}$ becomes $\mathrm{Mn}_{4} \mathrm{Si}_{\mathbf{6}} \mathrm{O}_{\mathbf{1 8}}$ |

## Summary for solving Empirical \& Molecular Formula Problems

## Empirical Formula

## Given: Percentage or mass of each element or compound.

1. Divide each percentage or mass by either the element's atomic weight or, if it 's a compound, its gram formula mass.
2. Divide each result by the smallest result.
3. Multiply each result by the SAME whole number to get a whole number result. (This step is not necessary for hydrates).
a. x. 25 --- multiply by 4
b. x. 33 --- multiply by 3
c. x .50 --- multiply by 2
d. x. 66 --- multiply by 3
e. x. 75 --- multiply by 4

## Molecular Formula

4. Find the gram formula mass of the empirical formula.
5. Divide the molecular formula mass (given) by the empirical formula mass (calculated).
6. Multiply each subscript by the result. (The result MUST be a whole number.)

## Homework:

Part I: Calculate the empirical formula for each of the following.

1. What is the empirical formula of a compound that is $25.9 \%$ nitrogen and $74.1 \%$ oxygen?
2. Determine the empirical formula of a compound that is composed of $88.8 \% \mathrm{O}, 11.1 \% \mathrm{H}$.
3. Magnetite is an iron ore with natural magnetic properties. It contains $72.5 \% \mathrm{Fe} \& 27.5 \% \mathrm{O}$. What is the empirical formula for magnetite?

4. An inorganic chemical used to treat burn patients is made up of silver, nitrogen, and oxygen in corresponding percentages of 78,10 , and 12. Calculate the empirical formula of this substance.
5. Propane is a hydrocarbon composed of $81.8 \%$ carbon and $18.2 \%$ hydrogen. What is its empirical formula?
6. What is the empirical formula of a compound that is sixty six percent calcium and the rest phosphorus?
7. Gigi is given 14.0 grams of an oxide of iron and asked to determine the empirical formula of the oxide. She finds that the sample contains 9.8 grams of iron and 4.2 grams of oxygen. What answer did she get?
8. 2-Methylpropene is a compound used to make synthetic rubber. A sample contains 0.556 g of carbon and 0.0933 g of hydrogen. Determine its empirical formula. Determine the molecular formula if the molecular formula mass is $56 \mathrm{~g} / \mathrm{mol}$.

Part II: Calculate the molecular formula for each of the following. (These are like the problems in part III above.) 9. What is the empirical formula of a compound that contains $46.2 \%$ carbon $\& 53.8 \%$ nitrogen? What is its molecular formula if it has a molecular mass of $52 \mathrm{~g} / \mathrm{mol}$.
10. A compound has a percentage composition of $40.0 \%$ carbon, $6.71 \%$ hydrogen and $53.3 \%$ oxygen. What is the empirical formula? What is the molecular formula if the compound has a molecular mass of $180.0 \mathrm{~g} / \mathrm{mol}$.
11. Ascorbic acid, also known as vitamin C, has a percentage composition of $40.9 \%$ carbon, $4.58 \%$ hydrogen, and $54.5 \%$ oxygen. Its molecular mass is $176.1 \mathrm{~g} / \mathrm{mol}$. What is its molecular formula?
12. Aspirin contains $60.0 \%$ carbon, $4.48 \%$ hydrogen, and $35.5 \%$ oxygen. It has a molecular mass of $180.0 \mathrm{~g} / \mathrm{mol}$. What are its empirical and molecular formulas?
13. Find the molecular formula of a compound with percentage composition $26.7 \% \mathrm{P}, 12.1 \% \mathrm{~N}$, and $61.2 \% \mathrm{Cl}$ and a molecular mass $695 \mathrm{~g} / \mathrm{mol}$.
